

REMARKS

As amended, claim 9 calls for a system in which, in response to the detection of an incoming call, a device separate from a telephone, called a first personal-use device, automatically obtains information and displays information about the caller. Then, in response to a user request, the processor within the first personal-use device automatically provides a second set of extended data that is a predetermined data related to the calling party.

It is believed that nothing of the sort is described in Bodnar. He simply displays a first set of data, as explained at the bottom of column 13 and the top of column 14. He does not provide the possibility that conveniently, the user can access base data quickly and extended data as required.

Likewise, nothing of the sort is described in the cited application to Smith. For example, in Figure 2 of Smith, there is a system in which information may be searched for. But there is no situation in which certain base data is automatically displayed and then, only in response to a user request, is more extended data obtained. Moreover, there is no teaching of automatically obtaining this second data in response to a request, the second data being predetermined data.

Therefore, reconsideration is respectfully requested.

Respectfully Submitted,

Date: June 12, 2007
